Scarlet Flame Creeping Phlox Phlox subulata 'Scarlet Flame'

Hardiness Zone: 2a

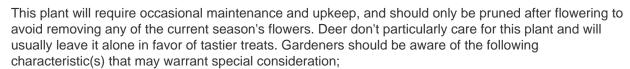

Other Names: Moss Phlox

Ornamental Features

Scarlet Flame Creeping Phlox is smothered in stunning lightly-scented scarlet star-shaped flowers at the ends of the stems from early to late spring. Its tiny needle-like leaves remain green in color throughout the year.

Landscape Attributes

Scarlet Flame Creeping Phlox is a dense herbaceous evergreen perennial with a ground-hugging habit of growth. It brings an extremely fine and delicate texture to the garden composition and should be used to full effect.

- Spreading

Scarlet Flame Creeping Phlox is recommended for the following landscape applications;

- Mass Planting
- Rock/Alpine Gardens
- Border Edging
- General Garden Use
- Groundcover

Planting & Growing

Scarlet Flame Creeping Phlox will grow to be only 6 inches tall at maturity, with a spread of 24 inches. Its foliage tends to remain low and dense right to the ground. It grows at a medium rate, and under ideal conditions can be expected to live for approximately 10 years. As an evegreen perennial, this plant will typically keep its form and foliage year-round.

This plant does best in full sun to partial shade. It prefers dry to average moisture levels with very well-drained soil, and will often die in standing water. It is considered to be drought-tolerant, and thus makes an ideal choice for a low-water garden or xeriscape application. It is not particular as to soil type, but has a definite preference for alkaline soils. It is highly tolerant of urban pollution and will even thrive in inner city environments. Consider covering it with a thick layer of mulch in winter to protect it in exposed locations or colder microclimates. This is a selection of a native North American species. It can be propagated by division; however, as a cultivated variety, be aware that it may be subject to certain restrictions or prohibitions on propagation.
